🎓 EDUCATION

The Australian National University (ANU), Canberra, Australia 07/2018 – 08/2020

Master of Environment (Advanced)

- GPA: 6.56/7.00; First Class Honours Equivalent
- Award: Senior Resident Scholarship; Activity: ANU Student Research Conference

Southwest University (SWU), Chongqing, China 09/2014 – 06/2018

Bachelor of Land Resource Management

- GPA: 83/100; Award: Foreign Academic Visit Scholarship
- Activity: Summer Program in Environmental Science (University of British Columbia, 2017)

🧰 EXPERIENCES

ANU Institute for Water Futures Canberra, Australia 01/2021 – Present

Research Officer Supervisor: Dr. Luigi Renzullo

Project: Data Assimilation into the AWRA-CMS for improved operational and forecast modelling

- Processing continent-scale remote sensing (RS) and soil grid data acquired from NASA, USGS and CSIRO. Establishing machine learning models by using packages from Python and R (e.g. scikit-learn and randomForest). Familiar with essential Linux commands and utilising programming modules from Gadi (a supercomputer located in the ANU campus) to complete research tasks.
- Undertaking testing and statistical analysis as required and preparing and disseminating relevant analysis reports to internal and external stakeholders, including external funding agencies.
- Participating in workshops and professional networks across campus to develop a broad base of industry knowledge, and providing input to improve the area's research practices and processes.

ANU Fenner School of Environment & Society Canberra, Australia 08/2019 – 12/2019

Research Assistant Supervisor: Dr. Tingbao Xu

- Assisting in the design and conduct of qualitative and quantitative research studies and in the analysis of data. Assisting in the preparation of research profiles, papers and literature reviews, including any archival work. Creating, testing, maintaining and managing relevant databases.
- Conducting analyses of the changing trends of regional-scale RS data (e.g. NDVI, rainfall and temperature) in various regions based on datasets from the National Oceanic and Atmospheric Administration (NOAA).
- Developed a linear model based on the ArcGIS platform to expose the links between land cover and NDVI data. Analysed the driving forces of NDVI change by incorporating Pearsons correlation analyses.

📖 DESCRIPTIONS OF MOST SIGNIFICANT PUBLICATIONS

[1] Outmigration Drives Cropland Decline and Woodland Increase in Rural Regions of Southwest China

- Used a case study in southwest China to investigate how regional land use patterns have been changed in the context of rural outmigration and assessed the resulting dynamics on local society, agriculture, and the ecological environment. Data from multiple sources (e.g. climatic datasets, statistics and NDVI) were utilised to conduct a comprehensive assessment.
- The results implied that vegetation improvement can occur in the context of depopulation and farmland reduction, which didn't significantly threaten local agriculture. It could be a good choice to allow those high-slope and biophysically poor farmlands to undergo natural ecological evolution rather than cultivation.
- This study provided new insights and more realistic scenarios for rural development. The findings are expected to provide a better understanding to enable sustainable land use management in southwest China.

[2] Irrigation Influencing Farmers' Perceptions of Temperature and Precipitation - A Comparative Study of Two Regions of the Tibetan Plateau

- Compared farmers' perceptions of temperature and precipitation change with meteorological data in two regions of the Tibetan Plateau and analysed how irrigation affects farmers' perceptions. Data were obtained from local meteorological stations and household questionnaires (N = 1005)
- This study found that farmers' perception of temperature change was consistent with meteorological data, but there was an obvious difference in precipitation perception between the two regions. The results also showed that irrigation facilities played a mediating role on precipitation perception and farmers having access to irrigation facilities were more likely to perceive increased precipitation.
- Provided suggestions to farmers and local governments that meteorological data and farmers' perceptions should be integrated when developing policies, and the consequences of climate change should be publicised to improve farmers' abilities of risk perception

[3] Fine-scale population mapping in Tibetan Plateau by using the ensemble machine learning approach

- Employed multiple machine learning models, including three individual model methods (random forest, XGBoost, and Cubist) and two multi-model ensemble methods (weighted average ensemble and stacking ensemble), to spatialise the population data of the Tibetan Plateau to a 30m-grid map
- Conducted an accuracy assessment which indicated that the spatialisation results of all models were better than the WorldPop dataset, a well-known and reliable database. The results help to provide accurate and detailed population grid data for various studies and a new method for the spatialisation of statistical data about the plateau region.

i SKILLS & CERTIFICATES

- **Software Packages:** ArcMap; EndNote; Microsoft Office; Origin; Google Earth Engine; LaTeX
- **Certificates:** First Aid Certificate; Youth Mental Health First Aider
- **Programming Languages:** Python; R
- **English Proficiency:** PTE 73
